Information Systems

Project Plan

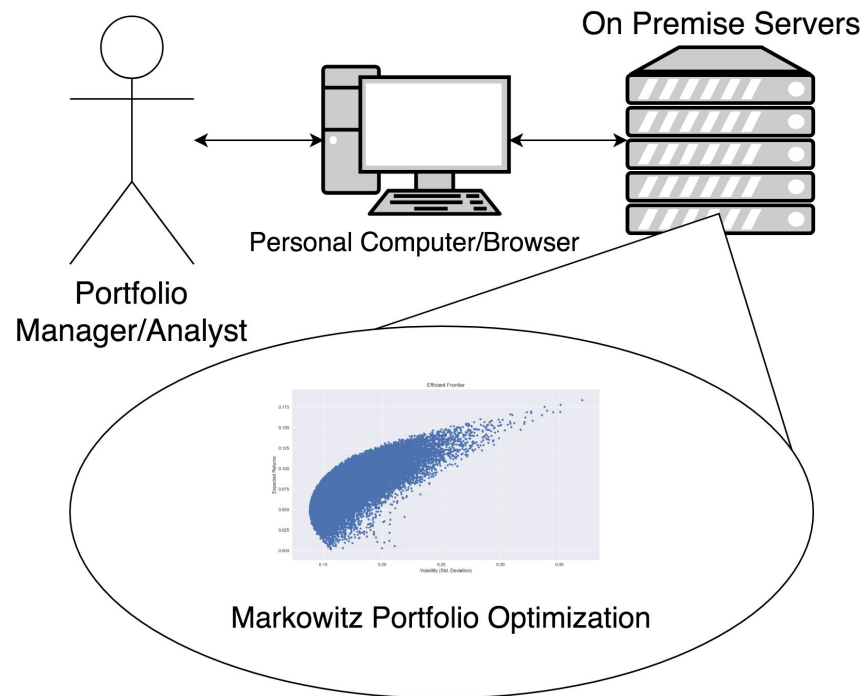

Problem Statement

- Portfolio managers (PM's) must decide the composition of assets within their real estate portfolio
- Asset, market and portfolio level analysis helps form this decision
- Principal utilizes a third party, Costar, to gain portfolio insight
 - Reports are long, inefficient, non-customizable, and pricy

Conceptual Sketch

- Input market data and portfolio holdings
- Perform Markowitz portfolio optimization
- Output analytical data visualization

Functional Requirements

User can ...

1. Generate optimal portfolios via configurable constraints such as market and property type
2. Visualize efficient frontiers compared to markets, property types, and the current portfolio
3. Visualize current holdings by geography, property type, expected return, and risk
4. Visualize differences between optimal and current holdings in maps, plots, and other charts
5. Receive recommend buy and sell decisions given the current portfolio holdings
6. Share results via file export and/or email

Non-functional Requirements

- The system will use only open source libraries and frameworks
- Principal data must not pass through non-vetted third party systems
- Optimization must take no longer than 5 seconds to calculate

Technical/Other Constraints/Considerations

- Principal has servers to host internal applications
- The application must be easy to use and should not require training
- Future project will be maintained by Principal's data science team

Market Survey (What Makes Us Unique)

- An inhouse tool keeps private data safe, and allows iteration and new feature development
- Most often, portfolio optimization and analysis tools are for the stock market
- Allows “what-if” real time analysis

Potential Risk & Mitigation

- The system is too slow and will reduce user experience
 - Portfolio optimization is not resource intensive
- Results are not in a format easily usable by the PMs
 - Coordinated user testing with Principal (Spring 2019)
- The system consumes sensitive data and may leak it
 - Only integrate Principal vetted systems

Resource/Cost Estimate

- The project is expected to incur little to no cost
- *May* need additional Power BI Azure licence.
- *May* use Principal's existing AWS RDS/EC2 instances for SQL DB

Project Milestones & Schedule

System Design

Detailed Design

Input specification:

- NCREIF market data
- Portfolio holdings

Output specification:

- Optimized portfolio
- Efficient frontier

UI and software specifications:

- JavaScript (runtime compiled)
- Modern browsers (Chrome)

Software/Technology Platforms Used

- Python
- Flask
- SQLite
- Dash
- Plotly
- Power BI

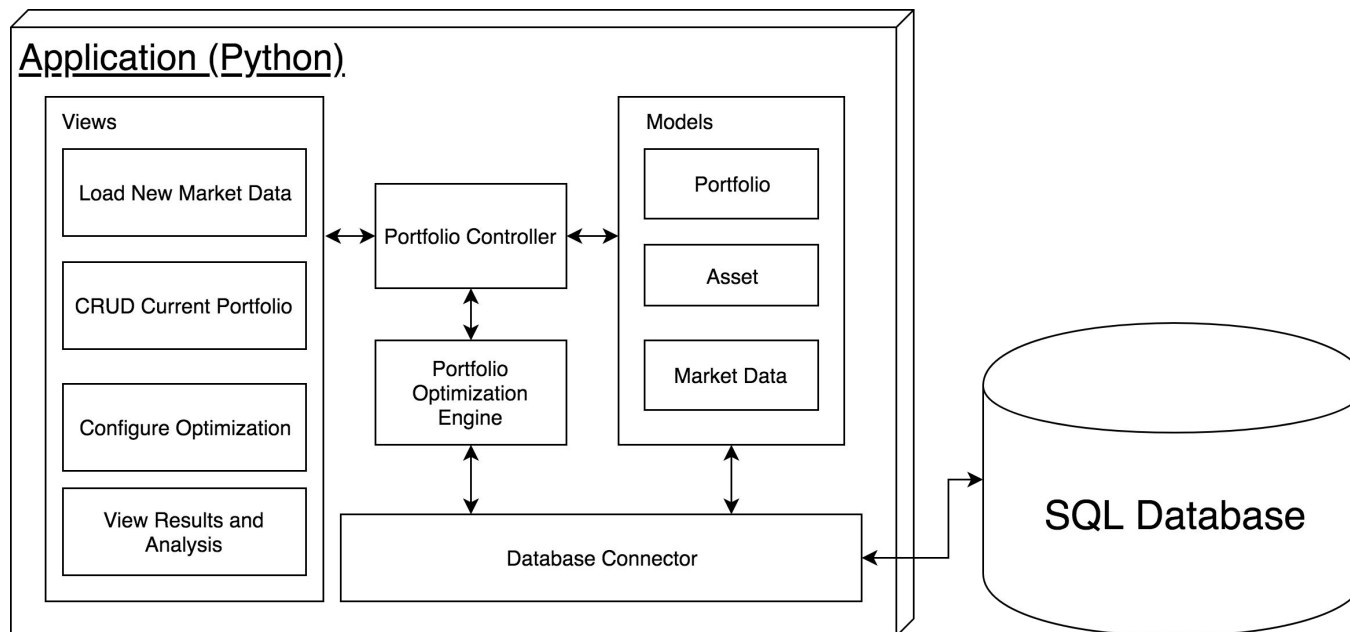

System Description / Operating Environment

- Operating System Agnostic
- Web application written in Python utilizing the Flask framework
- Client views built with Dash and Power BI
- SQLite or on premise SQL Database

System Block Diagram

User Interface

Dash, a Python library built on top of Plotly, compiles JavaScript data visualizations (i.e. charts and graphs)

The application consists of five major components:

- uploading portfolios
- creating constraints
- viewing the portfolio before and after it is optimized
- comparing both versions

Test Plan

- Utilize Python's unittest package
- Build database with known correlation
- User testing in Spring 2019

Prototype Implementations

```
constraints = [Constraint.market_max('Houston', 0.5)]  
risk_data, ret_data, weight_data = markowitz(db, user_constraints=constraints)
```

```
run(7): max_risk=7.5625   return: 2.848%   risk: 2.75%  
...  
Houston_____50.00%   Jacksonville_____0.00%   Lake County_____0.00%  
Los Angeles_____0.00%   Miami_____14.08%   Minneapolis_____0.00%  
...  
San Jose_____0.00%   Santa Barbara____35.92%   Seattle, WA_____0.00%
```

This is the Efficiency frontier graph

Conclusion

Project Status

Things We Have:

- Server (Flask/Dash Application)
- Markowitz implementation w/ market constraints

Things We Need:

- Fleshed out UI/UX
- Markowitz w/ property type and market/property type pair constraints

Plans For the Next Semester

- Prototype - January 2019
- Minimal Viable Product - March 2019
- User Testing - March & April 2019
- Automation of Deployment - April 2019
- Finalize Documentation and Project Handoff - May 2019
